# SingleChip 3-Axis Accelerometer QMA6981

The QMA6981 is a single chip three-axis accelerometer. This surface-mount, small sized chip has integrated acceleration transducer with signal condition ASIC, sensing tilt, motion, shock and vibration, targeted for applications such as screen rotation, step counting, sleep quality, gaming and personal navigation in mobile and wearable smart devices.

The QMA6981 is based on our state-of-the-art, high resolution single crystal silicon MEMS technology. Along with custom-designed 10-bit ADC ASIC, it offers the advantages of low noise, high accuracy, low power consumption, and offset trimming. The I<sup>2</sup>C serial bus allows for easy interface.

The QMA6981 is in a 2x2x0.95mm3 surface mount 12-pin land grid array (LGA) package.

## **FEATURES**

- ▶ 3-Axis Accelerometer in a 2x2x0.95 mm<sup>3</sup> Land Grid Array Package (LGA), guaranteed to operate over a temperature range of -40 °C to +85 °C.
- 10 Bit ADC with low noise accelerometer sensor
- I<sup>2</sup>C Interface with Standard and Fast modes.
- Built-In Self-Test
- Wide range operation voltage (2.4V To 3.6V) and low power consumption (220μA)
- Integrated FIFO with a depth of 32 frames
- RoHS compliant , halogen-free
- Built-in motion algorithm

## BENEFIT

- Small size for highly integrated products. Signals have been digitized and factory trimmed.
- High resolution allows for motion and tilt sensing
- High-Speed Interfaces for fast data communications.
   Maximum 2000Hz data output rate
- Enables low-cost functionality test after assembly in production
- Automatically maintains sensor's sensitivity under wide operation voltage range and compatible with battery powered applications
- For higher Data-Read rate
- Environmental protection and wide applications
- Low power and easy applications including step counting, sleep quality, gaming and personal navigation

| Line 2       | Y: the last digital of year CCC: lot code | 3 alphanumeric digits, variable to generate mass production trace-code  |
| Line3        | P: Part number<br>S: Sub-con ID           | P: 1 alphanumeric digits, fixed to identify part number, such as "A" stand for the part number QMA6981A2. S: 1 alphanumeric digits, variable identify sub-con, such as "C" stand for ChipMOS. |
| <b>(0)</b>   | Pin 1 identifier                          | Pin1 marking is positioned accordingly with unfilled-corner PIN on substrate.   |

# **4 EXTERNAL CONNECTION**

# 4.1 **Dual Supply Connection**

Figure 5. Dual Supply Connection

# 4.2 Single Supply connection

Figure 6. Single Supply Connection

# 5 BASIC DEVICE OPERATION

#### 5.1 Acceleration Sensors

The QMA6981 acceleration sensor circuit consists of tri-axial sensors and application specific support circuits to measure the acceleration of device. With a DC power supply is applied to the sensor two terminals, the sensor converts any accelerating incident in the sensitive axis directions to a differential voltage output.

# 5.2 Power Management

Device has two power supply pins. VDD is the main power supply for all of the internal blocks, including analog and digital. VDDIO is a separate power supply, for digital interface only. There is no limitation on the voltage levels of VDD and VDDIO relative to each other, as long as they are within operating range.

The device contains a power-on-reset generator. It generates reset pulse as power on, which can load the register's default value, for the device to function properly.

To make sure the POR block functions well, we should have such constrains on the timing of VDD.

The device should turn-on both power pins in order to operate properly. When the device is powered on, all registers are reset by POR, then the device transits to the standby mode and waits for further commends.

Table 6 provides references for four power states. Transitions between power state 2 and power state 3 are prohibited, due to leakage current concerns.

Table 6: Power States

| Power State | VDD       | VLOGIC    | Power State description   |  |  |  |
|-------------|-----------|-----------|---|--|--|--|
| 1           | 0V        | OV        | Device Off, No Power Consumption  |  |  |  |
| 2           | 0V        | 1.7v~3.6v | Device Off, Unpredictable Leakage Current on VLOGIC due to Floating Node. |  |  |  |
| 3           | 2.4v~3.6v | 0         | Device Off, Same Current as Standby Mode                                  |  |  |  |
| 4           | 2.4v~3.6v | 1.7v~3.6v | Device On, Normal Operation Mode, Enters Standby Mode after POR           |  |  |  |

## 5.3 Power On/Off Time

After the device is powered on, some time periods are required for the device fully functional. The external power supply requires a time period for voltage to ramp up (PSUP), it is typically 50 milli-second. However it isn't controlled by the device. The Power –On –Reset time period (PORT) includes time to reset all the logics, load values in NVM to proper registers, enter the standby mode and get ready for analogy measurements. The power on/off time related to the device is in Table 7.

Table 7. Time Required for Power On/Off

| Parameter  | Symbol | Condition                             | Min. | Тур. | Max. | Unit |
|------------|--------|---------------------------------------|------|------|------|------|
| POR        | PORT   | Time Period After VDD and             |      |      | 350  | uS   |
| Completion |        | VLOGIC at Operating Voltage           |      |      |      |      |
| Time       |        | to Ready for I <sup>2</sup> C Commend |      |      |      |      |
|            |        | and Analogy Measurement.              |      |      |      |      |

|            |        | Enable Next POR                       |      |      |      |      |

Power On/Off Timing

Figure 7. Power On/Off Timing

# 5.4 Communication Bus Interface I<sup>2</sup>C and Its Addresses

This device will be connected to a serial interface bus as a slave device under the control of a master device, such as the processor. Control of this device is carried out via I<sup>2</sup>C.

This device is compliant with I<sup>2</sup>C -Bus Specification, document number: 9398 393 40011. As an I<sup>2</sup>C compatible device, this device has a 7-bit serial address and supports I<sup>2</sup>C protocols. This device supports standard and fast speed modes, 100kHz and 400kHz, respectively. External pull-up resistors are required to support all these modes.

There are two I<sup>2</sup>C addresses selected by connecting pin 1 (AD0) to GND or VDD. The first six MSB are hardware configured to "001001" and the LSB can be configured by AD0.

Table 8. I2C Address Options

| AD0 (pin 10)   | I <sup>2</sup> C Slave Address(HEX) | I <sup>2</sup> C Slave Address(BIN) |
|----------------|-------------------------------------|-------------------------------------|
| Connect to GND | 12                                  | 0010010                             |
| Connect to VDD | 13                                  | 0010011                             |

If more I<sup>2</sup>C address options are required, please contact factory for metal layer changes.

## 5.5 Internal Clock

The device has an internal clock for internal digital logic functions and timing management. This clock is not available to external usage.

## 6 MODES OF OPERATION

## 6.1 Modes Transition

The device has two different operational modes, controlled by register (11H), mode bit. The main purpose of these modes is for power management. The modes can be transited from one to another, as shown below, through I<sup>2</sup>C commends of changing mode bits. The default mode is Standby.

Figure 8. Basic operation flow after power-on

The default mode after power on is standby mode. Through I2C instruction, device can switch between standby mode and active mode. With SOFTRESET by writing 0xB6 into register 0x36, all of the registers will get default values. SOFTRESET can be done both in active mode and in standby mode. Also, by writing 1 in NVM\_LOAD (0x33<3>) when device is in active mode, the NVM related image registers will get default value from NVM, however, other registers will keep the values of their own.

Figure 9. The work mode transferring

# 6.2 Description of Modes

#### 6.2.1 Active Mode

In active mode, there are two states, run state, and sleep state.

## 6.2.1.1 Sleep State

In sleep state, whole signal chain is off, including analog and digital signal conditioning. And the rest blocks are on, including REF and OSC.

### 6.2.1.2 Run State

In run state, the ADC digitizes the charge signals from transducer, and digital signal processor conditions these signals in digital domain, processes the interrupts, and send data into FIFO (accessible through register 0x3F) and Data registers (0x01~0x06). After the signal conditioning, the signal chain will be off and ASIC enters back into sleep state, leaves timer and FSM on. Also in sleep state, reference and power blocks are on. This mode can also be called as power cycling. The power cycling duty is configurable through state registers SLEEP\_DUR (0x11<3:0>). Device can enter into active mode by setting MODE\_BIT (0x11<7>) to logic 1.

Besides the power cycling, device can also be configured as FULLRUN, by setting SLEEP\_DUR=0000b. In this setting, no sleep state in the active mode, and device consumes most power, deliver the data most frequently.

#### 6.2.1.3 Self-test State

In active mode, when user set SELFTEST\_BIT (0x32<7>) to logic 1, ASIC will generate self-test signal onto the transducer, which transfer to electro-static force, to move the transducer. SELF\_TEST\_SIGN (0x32<2>) is used to set the force to negative.

For proper function of self-test, user should set SELFTEST\_BIT to logic 1 for at least 4mS, for the settling of transducer due to self-test force.

User can compare the data before self-test with that after self-test. If the difference between these two data is larger than value listed in following, the device functions well. Also, please make sure that no external acceleration is added on the device.

|                            | X axis | Y axis | Z axis |
|----------------------------|--------|--------|--------|
| Effective self-test signal | 0.3g   | 0.3g   | 0.3g   |

After done the self-test, please set the SELFTEST\_BIT back to logic 0.

#### 6.2.2 Standby Mode

In standby mode, most of the blocks are off, while device is ready for access through I2C. Standby mode is the default mode after power on or soft reset. Device can enter into this mode by set the soft reset register (0x36) to 0xB6 or set the MODE\_BIT (0x11<7>) to logic 0.

Besides the above two modes, device also contains NVM loading state. This state is used to reset the value of the NVM related image registers. There are two bits related to this state. When NVM\_LOAD (0x33<3>) is set to 1, NVM loading starts. When device is in NVM loading state, NVM\_RDY (0x33<2>) is set to logic 0 by device. After NVM loading finished, NVM\_RDY (0x33<2>) is set back to logic 1 by device, and NVM\_LOAD is reset to 0 by device automatically. NVM loading can only happen when NVM\_LOAD is set to 1 in active mode. If user set this NVM\_LOAD bit to 1 in standby mode, device will not take the action until the device enters into active state by setting MODE\_BIT (0x11<7>) to logic 1.

After loading NVM, the device will enter into standby mode directly.

The loading time for NVM is about 100uS.

# 7 Functions and interrupts

ASIC support interrupts, such as POL\_INT, FOB\_INT (4D/6D), FLAT\_INT, FF\_INT, TAP\_INT, SHK\_INT, SLO\_NO\_MOT\_INT, DRDY\_INT, FIFO\_INT, LPF, etc. (these functions are first priority)
Also we support SLOPE\_INT, HPF, high-g?, low-g, I2C watch dog timer, etc. (these functions are second priority)
If necessary, we support Master I2C and FIFO for mag. (these are third priority)
And, if necessary, we support SPI. (this is fourth priority)

## 7.1 POL INT

The POL \_INT stands for Portrait or Landscape interrupt, responses to the device in portrait direction or landscape direction. It includes 4 different event types, left, right, up and down events. The different type event stored and can be read from register ORIENT (0x0D<2:0>).

| POLA(0x0D<2:0>) | Left | Right | Down | Up | comments        |
|-----------------|------|-------|------|----|-----------------|
| 000             | 0    | 0     | 0    | 0  | unknown         |
| 001             | 1    | 0     | 0    | 0  | Left/Landscape  |
| 010             | 0    | 1     | 0    | 0  | Right/Landscape |
| 101             | 0    | 0     | 1    | 0  | Down/portrait   |
| 110             | 0    | 0     | 0    | 1  | Up/portrait     |

All different event can be detected by comparing the threshold set by register UD\_X\_TH(0x2D),RL\_Y\_TH(0x2F) with the sensor data , also have dependency on comparing result between the Z sensor readings and the register UD\_Z\_TH(0x2C) and RL\_Z\_TH(0x2E). Hysteresis can be introduced to the angle by decreasing a small offset for the threshold registers. All angle data inside the Hysteresis area will be regarded as unknown status in the orient status register (0x0D<2:0>).

Below Table shows the condition for kinds of orient events generation, the default threshold for X, Y is set to 40 degrees

| Event | X          |      | Υ          |      | Z                              |
|-------|------------|------|------------|------|--------------------------------|
| Up    | X >UD_X_TH | X <0 |            |      | Z  <ud_z_th< th=""></ud_z_th<> |
| Down  | X >UD_X_TH | X >0 |            |      | Z  <ud_z_th< th=""></ud_z_th<> |
| Right |            |      | Y >RL_Y_TH | Y <0 | Z  <rl_z_th< th=""></rl_z_th<> |
| Left  |            |      | Y >RL_Y_TH | Y >0 | Z  <rl_z_th< th=""></rl_z_th<> |

For the registers settings, all the orient events threshold 1 LSB bit stand for 3.9mg. For Z axis, it is 8-bit signed 2's complement number ranged from 0.3g to 1.29g, default value 0 as stands for 0.8g. X, Y axis are unsigned data, default value A4 stands for 640mg which angel be regards as 40 degree ,there will be around 10 degree dead band left. The degree value for event can be calculated by the equal arcsin(0.0039\*ud\_x\_th) or arcsin(0.0039\*rl y th).

The related interrupt status bit is ORIENT\_INT (0x09<6>). When the POL status changed, the value of ORIENT\_INT will be set to logic 1, and this will be cleared after the interrupt status register is read by user. ORIENT\_EN (0x16<6>) is the enable bit for the POL\_INT. Also, to get this interrupt on PIN\_INT1 and/or PIN\_INT2, we need to set INT1\_ORIENT (0x19<6>) or INT2\_ORIENT (0x1B<6>) to logic 1, to map the internal interrupt to the interrupt PINs.

# 7.2 FOB\_INT

The Front/back event detected by comparing Z axis data with a low g value, ranged from 0.1g to 0.6g, which is defined by FB Z TH(0x30). The comparing condition shows below:

| Event | Х | Υ | Z            |
|-------|---|---|--------------|
| Front |   |   | Z >FB_TH Z>0 |
| Back  |   |   | Z >FB_TH Z<0 |

The 2 different type events are stored and can be read from register ORIENT (0x0D<4:3>)

| FOB(0x0D<4:3>) | status   |
|----------------|----------|
| 00             | unknown  |
| 01             | Front    |
| 10             | Back     |
| 11             | Reserved |

Angle between the Z-axis and g can have the relationship:

Acc\_Z=1g X cos(theta).

Each threshold will introduce a dark area, which the Front/Back status cannot be recognized, the dark area angel is +/- (90-theta).

When the threshold register value is 0x00, the default value stands for 0.1g, and 1 LSB is 2mg. the minimum angel between sensor and g direction should be 84 degree, so the dark area should be +/-6 degree. When the value is 0xFF, the dark area should be +/-37 degree.

The related interrupt status bit is FOB\_INT (0x09<7>). When the FOB status changed, the value of FOB\_INT will be set to logic 1, and this will be cleared after the interrupt status register is read by user. FOB\_EN (0x16<6>) is the enable bit for the FOB\_INT. Also, to get this interrupt on PIN\_INT1 and/or PIN\_INT2, we need to set INT1\_FOB (0x19<7>) or INT2\_FOB (0x1B<7>) to logic 1, to map the interrupt to the interrupt PINs.

## 7.3 STEP/STEP QUIT INT

The STEP/STEP\_QUIT detect that the user is entering/exiting step mode. When the user enter into step mode, at least one axis sensor data will vary periodically, by numbering the variation periods the step counter can be calculated.

Figure 10. STEP/STEP QUIT

Median data (max+min) /2 is called dynamic threshold, the max and min data can be updated by certainly samples, the sample number can be set by register STEP\_SAMPLE\_CNT (0x12). When the sensor data decreasing (or increasing) through the dynamic threshold, a user run step is detected.

Register STEP\_PRECISION (0x13) is used as threshold when updating the new collected sensor data. Sensor data below the threshold will be discarded, this helps removing unstable variations causing failed detection. The run step event happened at certain interval timing. All of the events outside the timing window will not be regarded as a run step and the step counter will not counted. The timing window can be set by register STEP\_TIME\_UP(0x15) and STEP\_TIME\_LOW(0x14), the conversion ODR numbers ranged from STEP\_TIME\_LOW \*ODR to 8\* STEP\_TIME\_UP\*ODR . Also if no new run step event detected until the up limited timing threshold, STEP\_QUIT INT will generation.

To remove unstable variation which will cause failing STEP event detection, only after 4 continuous step detected, it will be considered as valid step events, also the step counter register STEP\_CNT\_LSB/ STEP\_CNT\_MSB (0x1C,0x1D) will updated immediately by value 4, interrupt STEP is generated as well.

The related interrupt status bit is STEP\_INT (0x0A<4 >) and STEP\_QUIT\_INT (0x0A<3>). When the interrupt is generated, the value of STEP\_INT/ STEP\_QUIT\_INT will be set to logic 1, and this will be cleared after the interrupt status register is read by user. STEP\_EN/STEP\_QUIT\_EN (0x16<3>/0x16<2>) is the enable bit for the STEP\_INT/STEP\_QUIT\_INT. Also, to get this interrupt on PIN\_INT1 and/or PIN\_INT2, we need to set INT1\_STEP (0x1A<3>)/INT1\_STEP\_QUIT (0x19<2>) or INT2\_STEP (0x1A<4>) /INT2\_STEP\_QUIT (0x1B<2>) to logic 1, to map the interrupt to the interrupt PINs.

## **7.4 TAP INT**

Tap detection allows the device to detect the events such as clicking or double clicking of a touch-pad. A tap event is detected if a pre-defined slope (absolute value of acceleration difference) of the acceleration of at least one axis is exceeded. The tap detection includes single tap (TAPS) and double tap (TAPD). A 'Single tap' is a single event within a certain time, followed by a certain quiet time. A 'double tap' consists of a first such event followed by a second event within a defined time frame.

Single tap interrupt can be enabled (disabled) by setting '1' ('0') to bit (0x16) S\_TAP\_EN. The double tap detection can be enabled (disabled) by setting '1' ('0') to (0x16) D\_TAP\_EN.

The status of single tap interrupt is stored in (0x0A) S\_TAP\_INT, the status of double tap interrupt is stored in (0x0A) D\_TAP\_INT.

The slope threshold for detecting a tap event is set by register (0x2B) TAP\_TH. The meaning of an LSB of (0x2B) TAP\_TH depends on the selected g-range: 1 LSB of the (0x2B) TAP\_TH is 62.5mg in 2g-range, 125mg in 4g-range, 250mg in 8g-range.

In figure the timing for single tap and double tap is visualized:

Figure 11. Timing of tap detction

The parameters (0x2A) TAP\_SHOCK and (0x2A) TAP\_QUIET are effect in both single tap and double tap detection, while (0x2A) TAP\_DUR is effect in double tap detection only. Within the duration of (0x2A) TAP\_SHOCK, any slope exceeding (0x2B) TAP\_TH after the first event will be ignored. Contrary to this, within duration of (0x2A) TAP\_QUIET, no slope exceeding (0x2B) TAP\_TH must occur, otherwise the first event will be cancelled. A single tap interrupt is generated after the combined duration of (0x2A) TAP\_SHOCK and (0x2A) TAP\_QUIET. The interrupt is cleared after a delay of 12.5ms.

A double tap interrupt is generated if an event fulfilling the conditions for a single tap occurs within the duration defined by (0x2A) TAP\_DUR after the completion of the first tap event. The interrupt is cleared after a delay of 12.5ms.

For each of parameter (0x2A) TAP\_SHOCK and (0x2A) TAP\_QUIET two values are selectable. By writing '0' ('1') to bit (0x2A) TAP\_SHOCK, the duration of (0x2A) TAP\_SHOCK is set to 50ms (75ms). By writing '0' ('1') to bit (0x2A) TAP\_QUIET, the duration of (0x2A) TAP\_QUIET is set to 30ms (20ms). The duration of (0x2A) TAP\_DUR can be set by (0x2A) TAP\_DUR bits:

| TAP_DUR | Duration of TAP_DUR |
|---------|---------------------|
| 000     | 50ms                |
| 001     | 100ms               |
| 010     | 150ms               |
| 011     | 200ms               |
| 100     | 250ms               |
| 101     | 375ms               |
| 110     | 500ms               |
| 111     | 700ms               |

The axis which triggered the interrupt is indicated by bits (0x0B) TAP\_FIRST\_X, (0x0B) TAP\_FIRST\_Y, and (0x0B) HIGH\_FIRST\_Z. The bit corresponding to the triggering axis contains a '1' while the other bits hold a '0'. These bits hold until new interrupt is triggered.

The sign of the triggering acceleration is stored in bit (0x0B) TAP\_SIGN. If the (0x0C) HIGH\_SIGN = '0' ('1'), the sign is positive (negative). This bit holds until new interrupt is triggered.

# 7.5 LOW-G\_INT

The low-g interrupt is based on the comparison of acceleration data against a low-g threshold for the detection of free-fall.

The low-g interrupt is enabled (disabled) by writing logic '1' ('0') to bits (0x17) LOW\_EN. There are two modes available, 'single' mode and 'sum' mode. In 'single' mode, the acceleration of each axis is compared with the threshold; in 'sum' mode, the sum of absolute value of all accelerations  $|acc_x| + |acc_y| + |acc_z|$  is compared with the threshold. The mode is selected by the contents of the (0x24) LOW\_MODE bit: '0' means 'single' mode, '1' means 'sum' mode.

The low-g threshold is set through the (0x23) LOW\_TH register. 1 LSB of (0x23) LOW\_TH always corresponds to an acceleration of 7.81mg (increment is independent from g-range setting).

A hysteresis can be set with the (0x24) LOW\_HYST bits. 1 LSB of (0x24) LOW\_HYST always corresponds to an acceleration of 125mg (as well, increment is independent from g-range setting).

The low-g interrupt is generated if the absolute values of the acceleration of all axes ('and' relation, in case of 'single' mode) or their sum (in case of 'sum' mode) are lower than the threshold for at least the time defined by the (0x22) LOW\_DUR register. The interrupt is reset if the absolute value of the acceleration of at least one axis ('or' relation, in case of 'single' mode) or the sum of absolute values (in case of 'sum' mode) is higher than the threshold plus the hysteresis for at least one data acquisition. The relation between the content of (0x25) LOW\_DUR and the actual delay of the interrupt generation is delay = [(0x22) LOW\_DUR+1]\*2ms. The interrupt status is stored in bit (0x0B) LOW\_INT.

## 7.6 HIGH-G INT

The high-g interrupt is based on the comparison of acceleration data against a high-g threshold for the detection of shock or other high-acceleration events.

The high-g interrupt is enabled (disabled) per axis by writing logic '1' ('0') to bits (0x17) HIGH\_EN\_X, (0x17) HIGH\_EN\_Y, and (0x17) HIGH\_EN\_Z, respectively. The high-g threshold is set through the (0x26) HIGH\_TH register. The meaning of an LSB of (0x26) HIGH\_TH depends on the selected g-range: it corresponds to 7.81mg in 2g-range (15.63mg in 4g-range, 31.25mg in 8g-range).

A hysteresis can be set with the (0x24) HIGH\_HYST bits. Analogously to the (0x26) HIGH\_TH, the meaning of an LSB of (0x24) HIGH\_HYST depends on the selected g-range: it corresponds to 125mg in 2g-range (250mg in 4g-range, 500mg in 8g-range).

The high-g interrupt is generated if the absolute value of the acceleration data of at least one of the enabled axes ('or' relation) is higher than the threshold for at least the time defined by the (0x25) HIGH\_DUR register. The interrupt is reset if the absolute value of the acceleration of all enabled axes ('and' relation) is lower than the threshold minus the hysteresis. The relation between the content of (0x25) HIGH\_DUR and the actual delay of the interrupt generation is delay =  $[(0x25) \text{ HIGH}_DUR+1]^*2\text{ms}$ .

The interrupt status is stored in bit (0x09) HIGH\_INT. The axis which triggered the interrupt is indicated by bits (0x0C) HIGH\_FIRST\_X, (0x0C) HIGH\_FIRST\_Y, and (0x0C) HIGH\_FIRST\_Z. The bit corresponding to the triggering axis contains a '1' while the other bits hold a '0'. These bits hold until new interrupt is triggered. The sign of the triggering acceleration is stored in bit (0x0C) HIGH\_SIGN. If the (0x0C) HIGH\_SIGN = '0' ('1'), the sign is positive (negative). This bit holds until new interrupt is triggered.

## 7.7 DRDY INT

The width of the acceleration data is 10 bits, in two's complement representation. The data of each axis is split into 2 parts, the MSB part (one byte contains bit 11 to bit 4) and the LSB part (one byte contains bit 3 to bit 0). Reading data should start with LSB part. When user is reading the LSB byte of data, to ensure the integrity of the acceleration data, the content of MSB can be locked, by setting SHADOW\_DIS (0x21<6>) to logic 0. This lock function can be disabled by setting SHADOW\_DIS to logic 1. Without lock, the MSB and LSB content will be updated by new value immediately. The bit NEW\_DATA in the LSB byte is the flag of the new data. If new data is updated, this NEW\_DATA flag will be 1, and will be cleared when corresponding MSB or LSB is read by user. Also user should note that, even with SHADOW\_DIS=0, the data of 3 axes are not guaranteed from the same time point. If user need all of the 3 axes data from the same time point, please use FIFO. Detailed information, user can refer to 6.8.

If SLEEP\_DUR is set to be 0000, then the data can be filtered by low-pass filter, with bandwidth is set by BW (0x10<4:0>). If SLEEP\_DUR is set to be other values, the data also can be averaged in different way (set by BW). In any conditions, the data stored in data registers are offset-compensated.

The device supports four different acceleration measurement ranges. The range is setting through RANGE

(0x0F<3:0>), and the details as following:

| RANGE  | Acceleration | Resolution |
|--------|--------------|------------|
|        | range        |            |
| 0001   | 2g           | 3.9mg/LSB  |
| 0010   | 4g           | 7.8mg/LSB  |
| 0100   | 8g           | 15.6mg/LSB |
| Others | Reserved     | 0.98mg/LSB |

The interrupt for the new data serves for the synchronous data reading for the host. It is generated after storing a new value of z-axis acceleration data into data register. This interrupt will be cleared automatically when the next data conversion cycle starts, when SLEEP\_DUR is not set to 0000b. When device is in full run (SLEEP\_DUR=0000), the interrupt will be effective about 128us, and automatically cleared.

The interrupt mode for the new data is fixed to be non-latched.

# 7.8 FIFO\_INT

The device has integrated FIFO memory, capable of storing up to 32 frames, with each frame contains three 10 bits words, for acceleration data of x, y, and z axis. All of the 3 axes acceleration are sampled at same point in time line.

The FIFO can be configured as three modes, FIFO mode, STREAM mode, and BYPASS mode. FIFO mode.

In FIFO mode, the acceleration data of selected axes are stored in the buffer memory. If enabled, a watermark interrupt can be triggered when the buffer filled up to the defined level. The buffer will continuously be filled until the fill level reaches to 32. When the buffer is full, data collection stops, and the new data will be ignored. Also, FIFO\_FULL interrupt will be triggered when enabled.

STREAM mode

In STREAM mode, the acceleration data of selected axes will be stored into the buffer until the buffer is full. The buffer's depth is 31 now. When the buffer is full, data collection continues, and the oldest data is discarded. If enabled, a watermark interrupt will be triggered when the fill level reached to the defined level. Also, when buffer is full, FIFO\_FULL interrupt will be triggered if enabled. If any old data is discarded, the FIFO\_OR (0x0E<7>) will be set to be logic 1.

BYPASS mode

In BYPASS mode, only the current acceleration data of selected axes can be read out from the FIFO. The FIFO acts like the STREAM mode with a depth of 1. Compare to reading directly from data register, this mode has the advantage of ensuring the package of xyz data are from same point of time line. The data registers are updated sequentially and have chance for the xyz data sampled in different time. Also, if any old data is discarded, the FIFO OR will be set to be logic 1, similar as that in stream mode.

The FIFO mode can be configured by setting FIFO\_MODE (0x3E<7:6>).

| FIFO_MODE | Mode   |
|-----------|--------|
| 00        | BYPASS |
| 01        | FIFO   |
| 10        | STREAM |
| 11        | FIFO   |

User can select the acceleration data of which axes to be stored in the FIFO. This configuration can be done by setting FIFO\_CH (0x3E<1:0>), where '00b' for x-, y-, and z-axis, '01b' for x-axis only, '10b' for y-axis only, '11b' for z-axis only.

If all the 3 axes data are selected, the format of data read from 0x3F is as follows

|  |  | XLSB | XMSB | YLSB | YMSB | ZLSB | ZMSB |
|--|--|------|------|------|------|------|------|
|--|--|------|------|------|------|------|------|

These comprise one frame

If only one axis is enabled, the format of data read from 0x3F is as follows

| • | iy one axio io en | abica, tric roilliat |
|---|-------------------|----------------------|
|   | YLSB              | YMSB                 |

These comprise one frame

If the frame is not read completely, the remaining parts of the frame will be discarded.

If the FIFO is read beyond the FIFO fill level, all zeroes will be read out.

FIFO\_FRAME\_COUNTER (0x0E<6:0>) reflects the current fill level of the buffer. If additional data frames are written into the buffer when the FIFO is full (in Stream mode or Bypass mode), then, FIFO\_OR (0x0E<7>) is set to 1. This FIFO\_OR can be considered as flag of discarding old data.

When a write access to one of the FIFO configuration registers (0x3E) or (0x31) occurs, the FIFO buffer will be cleared, the FIFO fill level indication register FIFO\_FRAME\_COUNTER (0x0E<6:0>) will be cleared, and the FIFO OR (0x0E<7>) will be cleared.

As mentioned, FIFO controller contains two interrupts, FIFO\_FULL interrupt, and watermark interrupt. These two interrupts are functional in all the FIFO operating modes.

The watermark interrupt is triggered when the fill level of buffer reached to the level that is defined by register FIFO\_WM\_TRIGGER (0x31<5:0>), if the interrupt is enabled by setting INT\_FWM\_EN (0x17<6>) to logic 1 and INT1\_FWM (0x1A<1>) or INT2\_FWM (0x1A<6>) is set.

The FIFO\_FULL interrupt is triggered when the buffer has been fully filled. In FIFO mode, the fill level is 32, and in STREAM mode the fill level is 31, in BYPASS mode the fill level is 1. To enable the FIFO\_FULL interrupt, INT\_FFULL (0x17<5>) should be set to 1, and INT1\_FFULL (0x1A<2>) or INT2\_FFULL (0x1A<7>) should be set to 1.

The status of watermark interrupt and fifo full interrupt can be read through INT\_STAT (0x0A). After soft-reset, the watermark interrupt and FIFO full interrupt are disabled.

For the FIFO to recollect the data, user should reconfigure the register FIFO\_MODE. (consult with app team)

# 7.9 Interrupt configuration

The device has the above 8 interrupt engines. Each of the interrupts can be enabled and configured independently. If the trigger condition of the enabled interrupt fulfilled, the corresponding interrupt status bit will be set to logic 1, and the mapped interrupt pin will be activated. The device has two interrupt PINs, INT1 and INT2. Each of the interrupts can be mapped to either PIN or both PINs.

The interrupt status registers update when a new data word is written into the data registers. If an interrupt is disabled, the related active interrupt status bit is disabled immediately.

The interrupt sequence is like the following

New data conversion, with or without filtering, judge the interrupt condition, new data written to data register, update interrupt status registers, trig associated interrupts, set mapped interrupt PINs, clear interrupts (depending on the interrupt mode), waiting for next data conversion.

Device supports 2 interrupt modes, non-latched, and latched mode. The interrupt modes are set through LATCH\_INT (0x21<0>).

In non-latched mode, the interrupt status bit and the mapped interrupt pin are cleared as soon as the associated conditions are no more valid, or read operation to the INT\_STAT (0x09~0x0b). Exceptions to this are the new data, orientation, and flat interrupts, which are automatically reset after a fixed time.

In latched mode, the clearings of the interrupt status and selected pin are determined by INT\_RD\_CLR (0x21<7>). If INT\_RD\_CLR=0, read operation to the INT\_STAT will clear the interrupt and the selected pin. If INT\_RD\_CLR=1, any read operation to the device will clear the interrupt and the selected pin.

If the condition for trigging the interrupt still holds, the interrupt status will be set again with the next change of the data registers.

Mapping the interrupt pins can be set by INT MAP (0x19~0x1B).

The electrical interrupt pins can be set INT\_PIN\_CONF (0x20<3:0>). The active logic level can be set to 1 or 0, and the interrupt pin can be set to open-drain or push-pull.

If the interrupt mode is configured as latched mode, the interrupt can also be cleared by I2C reading any of the interrupt status register  $(0x09 \sim 0x0c)$ . (should confirm with application team, check 0x21<7>)

# 8 I2C COMMUNICATION PROTOCOL

# 8.1 I<sup>2</sup>C Timings

Below table and graph describe the I<sup>2</sup>C communication protocol times

Table 9. I2C Timings

| Parameter                | Symbol             | Condition | Min. | Тур. | Max. | Unit |
|--------------------------|--------------------|-----------|------|------|------|------|
| SCL Clock                | f <sub>scl</sub>   |           | 0    |      | 400  | kHz  |
| SCL Low Period           | $t_{low}$          |           | 1    |      |      | μS   |
| SCL High Period          | $t_{high}$         |           | 1    |      |      | μS   |
| SDA Setup Time           | t <sub>sudat</sub> |           | 0.1  |      |      | μS   |

Figure 12. I<sup>2</sup>C Timing Diagram

# 8.2 I<sup>2</sup>C R/W Operation

## 8.2.1 Abbreviation

Table 10. Abbreviation

| SACK | Acknowledged by slave      |
|------|----------------------------|
| MACK | Acknowledged by master     |
| NACK | Not acknowledged by master |
| RW   | Read/Write                 |

## 8.2.2 Start/Stop/Ack

START: Data transmission begins with a high to transition on SDA while SCL is held high. Once I<sup>2</sup>C transmission starts, the bus is considered busy.

STOP: STOP condition is a low to high transition on SDA line while SCL is held high.

ACK: Each byte of data transferred must be acknowledged. The transmitter must release the SDA line during the acknowledge pulse while the receiver mush then pull the SDA line low so that it remains stable low during the high period of the acknowledge clock cycle.

NACK: If the receiver doesn't pull down the SDA line during the high period of the acknowledge clock cycle, it's recognized as NACK by the transmitter.

#### 8.2.3 I<sup>2</sup>C Write

I<sup>2</sup>C write sequence begins with start condition generated by master followed by 7 bits slave address and a write bit (R/W=0). The slave sends an acknowledge bit (ACK=0) and releases the bus. The master sends the one byte register address. The slave again acknowledges the transmission and waits for 8 bits data which shall be written to the specified register address. After the slave acknowledges the data byte, the master generates a stop signal and terminates the writing protocol.

Table 11. I2C Write

| ST  | Slave Address | R<br>W | SΑ  | R   | Register Address<br>(0x11) |   |   | S, | Data<br>(0x80) |   |    |   |   | SA | S |   |   |   |   |    |    |
|-----|---------------|--------|-----|-----|----------------------------|---|---|----|----------------|---|----|---|---|----|---|---|---|---|---|----|----|
| ART | 0 0 1 0 0 1 0 | 0      | \CK | 0 0 | 0                          | 1 | 0 | 0  | 0              | 1 | CK | 1 | 0 | 0  | 0 | 0 | 0 | 0 | 0 | ĆK | ЮР |

#### 8.2.4 I<sup>2</sup>C Read

 $I^2C$  write sequence consists of a one-byte  $I^2C$  write phase followed by the  $I^2C$  read phase. A start condition must be generated between two phase. The  $I^2C$  write phase addresses the slave and sends the register address to be read. After slave acknowledges the transmission, the master generates again a start condition and sends the slave address together with a read bit (R/W=1). Then master releases the bus and waits for the data bytes to be read out from slave. After each data byte the master has to generate an acknowledge bit (ACK = 0) to enable further data transfer. A NACK from the master stops the data being transferred from the slave. The slave releases the bus so that the master can generate a STOP condition and terminate the transmission.

The register address is automatically incremented and more than one byte can be sequentially read out. Once a new data read transmission starts, the start address will be set to the register address specified in the current I<sup>2</sup>C write command.

# 9.2 Register Definition

Register 0x00 (CHIP ID)

| Bit7      | Bit6 | Bit5 | Bit4 | Bit3 | Bit2 | Bit1 | Bit0 | R/W | Default |
|-----------|------|------|------|------|------|------|------|-----|---------|
| Device ID |      |      |      |      |      |      |      | RW  |         |

This register is used to identify the device

Register 0x01 ~ 0x02 (DXL, DXM)

| Bit7    | Bit6    | Bit5 | Bit4 | Bit3 | Bit2 | Bit1 | Bit0   | R/W | Default |  |  |
|---------|---------|------|------|------|------|------|--------|-----|---------|--|--|
| DX<1:0> |         |      |      |      |      |      | NEWDAT | R   | 0x00    |  |  |
|         |         |      |      |      |      |      | A_X    |     |         |  |  |
| DX<9:2> | DX<9:2> |      |      |      |      |      |        |     |         |  |  |

DX: 10bits acceleration data of x-channel. This data is in two's complement.

NEWDATA\_X: 1, acceleration data of x-channel has been updated since last reading

0, acceleration data of x-channel has not been updated since last reading

Register 0x03 ~ 0x04 (DYL, DYM)

| Bit7    | Bit6 | Bit5 | Bit4 | Bit3 | Bit2 | Bit1 | Bit0   | R/W | Default |
|---------|------|------|------|------|------|------|--------|-----|---------|
| DY<1:0> |      |      |      |      |      |      | NEWDAT | R   | 0x00    |
|         |      |      |      |      |      |      | A_Y    |     |         |
| DY<9:2> |      |      |      |      |      |      |        | R   | 0x00    |

DY: 10bits acceleration data of y-channel. This data is in two's complement. NEWDATA\_Y: 1, acceleration data of y-channel has been updated since last reading

0, acceleration data of y-channel has not been updated since last reading

Register 0x05 ~ 0x06 (DZL, DZM)

|         |      | ,    |      |      |      |      |               |     |         |
|---------|------|------|------|------|------|------|---------------|-----|---------|
| Bit7    | Bit6 | Bit5 | Bit4 | Bit3 | Bit2 | Bit1 | Bit0          | R/W | Default |
| DZ<1:0> |      |      |      |      |      |      | NEWDAT<br>A Z | R   | 0x00    |
| DZ<9:2> |      |      |      |      | I    |      | /             | R   | 0x00    |

DZ: NEWDATA Z: 10bits acceleration data of z-channel. This data is in two's complement.

ATA\_Z: 1, acceleration data of z-channel has been updated since last reading

0, acceleration data of z-channel has not been updated since last reading

Register 0x07 ~ 0x08 (ID)

| Bit7 | Bit6    | Bit5  | Bit4 | Bit3 | Bit2 | Bit1 | Bit0 | R/W | Default |
|------|---------|-------|------|------|------|------|------|-----|---------|
|      | NT_LSB  |       |      |      |      |      |      | R   | 0x00    |
|      | STEP CN | T MSB |      |      |      |      |      | R   | 0x00    |

STEP\_CNT\_LSB The least significant 8 bits of step count The most significant 8 bits of step count

Register 0x0a (INT\_STAT0)

| 111911111 |          | /       |         |         |           |          |      |     |         |
|-----------|----------|---------|---------|---------|-----------|----------|------|-----|---------|
| Bit7      | Bit6     | Bit5    | Bit4    | Bit3    | Bit2      | Bit1     | Bit0 | R/W | Default |
| FOB_INT   | ORIENT_I | S_TAP_I | D_TAP_I | STEP_IN | STEP_Q    | STEP_UN  |      | R   | 0x00    |
|           | NT       | NT      | NT      | Т       | LIIT INIT | SIMIL AR |      |     |         |

FOB\_INT: 1, front-back interrupt active

0, front-back interrupt inactive

ORIENT\_INT: 1, orient interrupt active 0, orient interrupt inactive

S\_TAP\_INT: 1, single tap interrupt inactive 0, single tap interrupt inactive

D\_TAP\_INT: 1, double tap interrupt active 0, double tap interrupt inactive

STEP\_INT: 1, step valid interrupt is active

0, step valid interrupt is inactive STEP\_QUIT\_INT: 1, step quit interrupt is active

0, step quit interrupt is inactive STEP\_UNSIMILAR: 1, step unsimilar interrupt is active

0, step unsimilar interrupt is inactive

Register 0x0b (INT\_STAT1)

|      | Register 0x0b (INT_STATT) |         |          |         |          |      |      |     |         |  |  |  |  |  |
|------|---------------------------|---------|----------|---------|----------|------|------|-----|---------|--|--|--|--|--|
| Bit7 | Bit6                      | Bit5    | Bit4     | Bit3    | Bit2     | Bit1 | Bit0 | R/W | Default |  |  |  |  |  |
|      | FIFO_WM                   | FIFO_FU | DATA_IIN | LOW_INT | HIGH-INT |      |      | R   | 0x00    |  |  |  |  |  |
|      | INT                       | LL INT  | TT       |         |          |      |      |     |         |  |  |  |  |  |

This register indicates interrupt status related to data ready, FIFO watermark, and FIFO full.

FIFO\_WM\_INT: 1, FIFO watermark interrupt active

0, FIFO watermark interrupt inactive

FIFO\_FULL\_INT: 1, FIFO full interrupt active 0, FIFO full interrupt inactive

DATA\_INT: 1, data ready interrupt active 0, data ready interrupt inactive

**QST** Corporation

LOW\_INT: 1, low-g interrupt active 0, low-g interrupt inactive

HIGH\_INT: 1, high-g interrupt active

0, high-g interrupt inactive

Register 0x0c (INT\_STAT2)

| Bit7    | Bit6    | Bit5    | Bit4    | Bit3    | Bit2    | Bit1    | Bit0    | R/W | Default |
|---------|---------|---------|---------|---------|---------|---------|---------|-----|---------|
| TAP_SIG | TAP_FIR | TAP_FIR | TAP_FIR | HIGH_SI | HIGH_FI | HIGH_FI | HIGH_FI | R   | 0x00    |
| N       | ST Z    | ST Y    | ST X    | GN      | RST Z   | RST Y   | RST X   |     |         |

TAP\_SIGN: 1, sign of tap triggering is negative

0, sign of tap triggering signal is positive TAP\_FIRST\_Z: 1, tap interrupt is triggered by Z axis

0, tap interrupt is not triggered by Z axis

TAP\_FIRST\_Y: 1, tap interrupt is triggered by Y axis

O, tap interrupt is not triggered by Y axis
TAP\_FIRST\_X:

1, tap interrupt is triggered by X axis
0, tap interrupt is not triggered by X axis

HIGH\_SIGN: 1, sign of high-g triggering signal is negative

0, sign of high-g triggering signal is positive

HIGH\_FIRST\_Z: 1, high-g interrupt is triggered by Z axis 0, high-g interrupt is not triggered by Z axis

HIGH\_FIRST\_Y: 1, high-g interrupt is triggered by Y axis

0, high-g interrupt is not triggered by Y axis HIGH\_FIRST\_X: 1, high-g interrupt is triggered by X axis

0, high-g interrupt is not triggered by X axis

Register 0x0d (INT\_STAT3)

| Bit7    | Bit6 | Bit5 | Bit4     | Bit3 | Bit2      | Bit1 | Bit0 | R/W | Default |
|---------|------|------|----------|------|-----------|------|------|-----|---------|
| STEP_CN |      |      | FOB<1:0> |      | ORIENT<2: | 0>   |      | R   | 0x00    |
| T_OVFL  |      |      |          |      |           |      |      |     |         |
|         |      |      |          |      |           |      |      |     |         |

STEP\_CNT\_OVFL: 1, step counter is over-flowed

0, step counter is not over-flowed

FOB<1:0>: 00, device is in unknown orientation

01, device is in front orientation10, device is in back orientation

11, reserved

ORIENT<2:0>: 000, device is in unknown orientation

001, device is in left orientation 010, device is in right orientation

011, reserved 100, reserved

101, device is in down orientation 110, device is in up orientation

111, reserved

Register 0x0e (FIFO\_STATE)

| Bit7    | Bit6                  | Bit5 | Bit4 | Bit3 | Bit2 | Bit1 | Bit0 | R/W | Default |
|---------|-----------------------|------|------|------|------|------|------|-----|---------|
| FIFO OR | FIFO FRAME COUNT<6:0> |      |      |      |      |      |      | R   | 0x00    |

FIFO\_OR:

1, FIFO over run occurred 0, FIFO over run not occurred

FIFO\_FRAME\_COUNT<6:0>:

Fill level of FIFO buffer. An empty FIFO corresponds to 0x00. The frame counter can be cleared by reading out all of the frames, or by writing register 0x3e (FIFO\_CFG1) or 0x31.

Register 0x0f (RANGE)

| Bit7 | Bit6 | Bit5 | Bit4 | Bit3      | Bit2 | Bit1 | Bit0 | R/W | Default |
|------|------|------|------|-----------|------|------|------|-----|---------|
|      |      |      |      | RANGE<3:0 | )>   |      |      | RW  | 0x00    |

RANGE<3:0>: set the full scale of the accelerometer. Setting as following

| RANGE<3:0> | Acceleration range | Resolution |
|------------|--------------------|------------|
| 0001       | 2g                 | 3.9mg/LSB  |
| 0010       | 4g                 | 7.8mg/LSB  |
| 0100       | 8g                 | 15.6mg/LSB |
| Others     | Reserved           | 0.98mg/LSB |

Register 0x10 (BW)

| Bit7 | Bit6 | Bit5 | Bit4    | Bit3 | Bit2 | Bit1 | Bit0 | R/W | Default |
|------|------|------|---------|------|------|------|------|-----|---------|
|      |      | ODRH | BW<4:0> |      |      |      |      | RW  | 0x00    |

ODRH:

1, higher output data rate, ODR = 4\*F\_BW 0, lower output data rate, ODR = 2\*F\_BW

BW<4:0>: bandwidth setting, as following

**QST** Corporation

| BW<4:0> | F_BW (Bandwidth) | ODR (0x10<5>=0) | ODR (0x10<5>=1) |
|---------|------------------|-----------------|-----------------|
| xx000   | 3.9Hz            | 7.8Hz           | 15.6Hz          |
| xx001   | 7.8Hz            | 15.6Hz          | 31.2Hz          |
| xx010   | 15.6Hz           | 31.2Hz          | 62.5Hz          |
| xx011   | 31.2Hz           | 62.5Hz          | 125Hz           |
| xx100   | 62.5Hz           | 125Hz           | 250Hz           |
| xx101   | 125Hz            | 250Hz           | 500Hz           |
| xx110   | 250Hz            | 500Hz           | 1000Hz          |
| xx111   | 500Hz            | 1000Hz          | 2000Hz          |

Even if unfiltered data is used, the ODR is still set by BW value.

Register 0x11 (POWER)

| Bit7    | Bit6 | Bit5      | Bit4 | Bit3     | Bit2   | Bit1 | Bit0 | R/W | Default |
|---------|------|-----------|------|----------|--------|------|------|-----|---------|
| MODE_BI | DSLP | PRESET<1: | <0>  | SLEEP_DU | R<3:0> |      |      | RW  | 0x00    |
| Т       |      |           |      |          |        |      |      |     |         |

MODE\_BIT:

1, set device into active mode

DSLP:

0, set device into standby mode 1, enable deep sleep. This action can lower down the power consumption more

0, disable deep sleep

PRESET<1:0>:

Preset time setting. The preset time is reserved for CIC filter in digital

11, Tpreset=2048us 10, Tpreset=768us 01, Tpreset=96us 00, Tpreset=12us

SLEEP DUR<3:0>:

Set the sleep time, when device is in power cycling power saving.

| SLEEP_DUR<3:0> | Sleep time Tsl                |
|----------------|-------------------------------|
| 0000           | No power cycling / full speed |
| 0001~0101      | 0.5ms                         |

| CLR     | _DIS   | SE      |      |      |      |      | NT      |     |         |

INT\_RD\_CLR:

1, clear all the interrupts in latched-mode, when any read operation to this device

0, clear all the interrupts, only when read the register INT\_STAT (0x0A~0x0B), no matter the interrupts in latched-mode, or in

non-latched-mode

SHADOW\_DIS:

1, disable the shadowing function for the acceleration data

0, enable the shadowing function for the acceleration data. When shadowing is enabled, the MSB of the acceleration data is locked, when corresponding LSB of the data is reading. This can ensure the integrity of the acceleration data during the reading.

The MSB will be unlocked when the MSB is read.

INT\_PULSE:

1, data ready interrupt is kept until next conversion starts, in power cycling

0, pulse of data ready interrupt is fixed to be 128us

LATCH\_INT:

1, interrupt is in latch mode
0, interrupt is in non-latch mode

Register 0x22 (LOW HIGH G 0)

| Bit7    | Bit6      | Bit5 | Bit4 | Bit3 | Bit2 | Bit1 | Bit0 | R/W | Default |
|---------|-----------|------|------|------|------|------|------|-----|---------|
| LOW_DUR | LOW_DUR F |      |      |      |      |      |      |     |         |

LOW\_DUR:

low-g interrupt triggered delay, the actual time is (LOW\_DUR<7:0>+1)\*2ms; the default delay time is 20ms

Register 0x23 (LOW HIGH G 1)

| Bit7   | Bit6 | Bit5 | Bit4 | Bit3 | Bit2 | Bit1 | Bit0 | R/W | Default |
|--------|------|------|------|------|------|------|------|-----|---------|
| LOW_TH |      |      |      |      |      |      |      | RW  | 0x30    |

LOW\_TH: low-g interrupt threshold, the actual g value is (LOW\_TH<7:0>)\*7.8mg; the default value is 375mg

Register 0x24 (LOW\_HIGH\_G\_2)

| Bit7           | Bit6 | Bit5 | Bit4 | Bit3 | Bit2   | Bit1     | Bit0   | R/W | Default |

ORIENT DB DIS: 1: disable orient denounce time

0: enable orient denounce time

FB\_Z\_TH<6:0>: Front/back z axis threshold, the actual g value is FB\_Z\_TH<7:0>\*3.91mg+0.1g, independent of the selected g range

Register 0x31 (FIFO\_WTMK)

| Trogister ox | 01 (111 0_111 | IVII ()  |            |      |      |      |      |     |         |
|--------------|---------------|----------|------------|------|------|------|------|-----|---------|
| Bit7         | Bit6          | Bit5     | Bit4       | Bit3 | Bit2 | Bit1 | Bit0 | R/W | Default |
|              |               | FIFO WTM | K LVL<5:0> |      |      |      |      | RW  | 0x00    |

FIFO WTMK LVL<5:0>:

defines FIFO water mark level. Interrupt will be generated, when the number of entries in the FIFO exceeds FIFO\_WTMK\_LVL<5:0>. When the value of this register is changed, the FIFO\_FRAME\_COUNTER is reset to 0.

Register 0x32 (ST\_CONF)

| Bit7    | Bit6 | Bit5  | Bit4     | Bit3      | Bit2    | Bit1     | Bit0      | R/W | Default |
|---------|------|-------|----------|-----------|---------|----------|-----------|-----|---------|
| SELFTES |      |       | SELFTES  | SingleEn_ | SELFTES | SELFTEST | AXIS<1:0> | RW  | 0x00    |
| T_BIT   |      |       | T_AMP/E  | Step      | T_SIGN  |          |           |     |         |
| _       |      | ) \ \ | n_Peak_V | · ·       |         |          |           |     |         |
|         |      |       | alley    |           |         |          |           |     |         |

SELFTEST\_BIT: 1, self-test enabled. When self-test enabled, a delay of 3ms is necessary for the value settling.

0, normal

SELFTEST\_AMP/En\_Peak\_Valley:

This bit is multiple used by SELFTEST\_AMP and En\_Peak\_Valley,

When used as SELFTEST\_AMP: 1, set high amplitude for self-test force 0, set low amplitude for self-test force

When used as En\_Peak\_Valley:
1, enable Peak and Valley match in step counter

disable Peak and Valley match in step counter

SingleEn\_Step: 1, enable single axis mode in step counter 0, disable single axis mode in step counter

SELFTEST\_SIGN: 1, set self-test excitation positive

**QST** Corporation

30

0, set self-test excitation negative

#### SELFTEST\_AXIS<1:0>:

These two bits are used to select axis for selftest or step counter

When SELFTEST\_BIT (0x32<7>) is enabled:

00, x axis 01, y axis 10, z axis 11, z axis

When STEP\_EN (0x16<3>) is enabled,

00, x axis 01, y axis 10, z axis 11. z axis

When STEP\_EN (0x16<3>) and SingleEn\_Step (0x32<3>) is enabled,

00, x axis 01, y axis 10, z axis 11, z axis

Register 0x34 (VALLEY\_A)

| Bit7     | Bit6  | Bit5 | Bit4 | Bit3 | Bit2 | Bit1 | Bit0 | R/W | Default |
|----------|-------|------|------|------|------|------|------|-----|---------|
| VALLEY_A | <5:0> |      |      |      |      |      |      | RW  | 0x00    |

VALLEY\_A<5:0>:

valley value of one axis which is used for step valley match

Register 0x1f (PEAK\_A)

| Bit7   | Bit6  | Bit5 | Bit4 | Bit3 | Bit2 | Bit1           | Bit0        | R/W | Default |
|--------|-------|------|------|------|------|----------------|-------------|-----|---------|
| PEAK_A | <5:0> |      |      |      |      | STEP_M<br>1:0> | IISMATCH_A< | RW  | 0x00    |

PEAK\_A<5:0>: pe

peak value of one axis which is used for step peak match

STEP\_MISMATCH\_A<1:0>:

precision for step peak and valley match 00, match VALLEY\_A<5:1> and PEAK\_A<5:1> 01, match VALLEY\_A<5:2> and PEAK\_A<5:2> 10, match VALLEY\_A<5:3> and PEAK\_A<5:3> 11, match VALLEY\_A<5:4> and PEAK\_A<5:4>

Register 0x33 (NVM)

| Bit7   | Bit6 | Bit5 | Bit4 | Bit3   | Bit2   | Bit1   | Bit0 | R/W | Default |
|--------|------|------|------|--------|--------|--------|------|-----|---------|
| UNLOCK |      |      |      | NVM_LO | NVM_RD | NVM_PR |      | RW  | 0x04    |
| _3F    |      |      |      | AD     | Y      | OG     |      |     |         |

UNLOCK\_3F:

- 1, unlock the burst-reading of FIFO. The burst-reading can access registers behind 0x3F. This option is reserved for internal test.
- 0, lock the burst-reading of FIFO. The register address will be locked at 0x3F, for normal use.

NVM\_LOAD:

- 1, trigger loading register from NVM 0, not trigger loading register form NVM
- This bit is cleared when NVM loading is done

NVM\_RDY:

- 1, NVM is ready, loading or programing NVM is done
- 0, NVM is not ready, loading or programming NVM is in progress.

NVM\_RDY is read-only to customer.

NVM\_PROG:

- 1, trigger programing NVM 0, not trigger programming NVM
  - This bit is cleared when NVM programming is done

Register 0x36 (SR)

| - togiotor ont | 30 (3.1) |      |      |      |      |      |      |     |         |
|----------------|----------|------|------|------|------|------|------|-----|---------|
| Bit7           | Bit6     | Bit5 | Bit4 | Bit3 | Bit2 | Bit1 | Bit0 | R/W | Default |
| SOFT RES       |          |      |      |      |      |      |      | RW  | 0x00    |

SOFT\_RESET:

0xB6, reset all of the registers 0xB3, unlock NVM for programming (not open to customer)

This register is cleared when reset or NVM programming is done

Register 0x37 (OFFSET\_XY)

| Bit7    | Bit6     | Bit5 | Bit4       | Bit3 | Bit2     | Bit1   | Bit0 | R/W | Default |
|---------|----------|------|------------|------|----------|--------|------|-----|---------|
| OFFSET_ | _X<10:8> |      | GAIN_Z<9:8 | 3>   | OFFSET_Y | <10:8> |      | RW  | NVM     |

OFFSET\_X<10:8>: offset value of x-channel. This data is the trimming data for x channel in FT phase, together with OFFSET\_X<7:0> in 0x38. GAIN\_Z<9:8>: sensitivity trimming bits for z channel, together with GAIN\_Z<7:0> in 0x3D (total 10 bits).

OFFSET\_Y<10:8>: offset value of y-channel. This data is the trimming data for y channel in FT phase, together with OFFSET\_Y<7:0> in 0x39.

Register 0x38 (OFFSET\_X)

| Bit7     | Bit6  | Bit5 | Bit4 | Bit3 | Bit2 | Bit1 | Bit0 | R/W | Default |
|----------|-------|------|------|------|------|------|------|-----|---------|
| OFFSET X | <7:0> |      |      |      |      |      |      | RW  | NVM     |

OFFSET\_X<7:0>:

offset value of x-channel. This data is the trimming data for x channel in FT phase, together with OFFSET\_X<10:8> in 0x37<7:5>.

The trimming LSB is 4mg, the full trimming range in digital domain is +-4g

User can perform read-modify-write access, to change the register value. However, when device is re-power-on, or soft-reset, this value will be updated to default again.

Register 0x39 (OFFSET\_Y)

| Bit7     | Bit6  | Bit5 | Bit4 | Bit3 | Bit2 | Bit1 | Bit0 | R/W | Default |
|----------|-------|------|------|------|------|------|------|-----|---------|
| OFFSET Y | <7:0> |      |      |      |      |      |      | RW  | NVM     |

OFFSET\_Y<7:0>:

offset value of y-channel. This data is the trimming data for y channel in FT phase, together with OFFSET\_Y<10:8> in 0x37<2:0>.

The trimming LSB is 4mg, the full trimming range in digital domain is +-4g

User can perform read-modify-write access, to change the register value. However, when device is re-power-on, or soft-reset, this value will be updated to default again.

Register 0x3a (OFFSET\_Z)

| Bit7          | Bit6 | Bit5 | Bit4 | Bit3 | Bit2 | Bit1 | Bit0 | R/W | Default |
|---------------|------|------|------|------|------|------|------|-----|---------|
| OFFSET_Z<7:0> |      |      |      |      |      |      |      |     | NVM     |

OFFSET\_Z<7:0>:

offset value of z-channel. This data is the trimming data for z channel in FT phase, together with OFFSET\_Z<11:8> in 0x45<3:0>. The trimming LSB is 4mg, the full trimming range in digital domain is +-8g

User can perform read-modify-write access, to change the register value. However, when device is re-power-on, or soft-reset, this value will be updated to default again.

Register 0x3b (GAIN\_X) not open to customer

| Bit7   | Bit6 | Bit5 | Bit4 | Bit3 | Bit2 | Bit1 | Bit0 | R/W | Default |
|--------|------|------|------|------|------|------|------|-----|---------|
| GAIN_X |      |      |      |      |      |      |      | RW  | NVM     |

GAIN\_X:

sensitivity trimming bits for x channel (total 8 bits).

Gain\_total = (256 + GAIN\_X) / 256

Gain rang is from 1 to 2, the worst gain accuracy is 1/256 ~= 0.4%

Register 0x3c (GAIN\_Y) not open to customer

| Bit7   | Bit6 | Bit5 | Bit4 | Bit3 | Bit2 | Bit1 | Bit0 | R/W | Default |
|--------|------|------|------|------|------|------|------|-----|---------|
| GAIN Y |      |      |      |      |      |      |      | RW  | NVM     |

GAIN\_Y:

sensitivity trimming bits for y channel (total 8 bits).

 $Gain_total = (256 + GAIN_Y) / 256$ 

Gain rang is from 1 to 2, the worst gain accuracy is 1/256 ~= 0.4%

Register 0x3d (GAIN\_Z) not open to customer

| Bit7     | Bit6 | Bit5 | Bit4 | Bit3 | Bit2 | Bit1 | Bit0 | R/W | Default |
|----------|------|------|------|------|------|------|------|-----|---------|
| GAIN_Z<7 | :0>  |      |      |      |      |      |      | RW  | NVM     |

GAIN\_Z:

sensitivity trimming bits for z channel, together with GAIN\_Z<9:8> in 0x37<4:3> (total 10 bits).

 $Gain_total = (128 + GAIN_Z) / 256$ 

Gain rang is from 0.5 to 4.5, the worst gain accuracy is 1/128 ~= 0.8%

Register 0x3e (FIFO\_CFG)

| Ī | Bit7           | Bit6 | Bit5 | Bit4 | Bit3 | Bit2 | Bit1      | Bit0 | R/W | Default |
|---|----------------|------|------|------|------|------|-----------|------|-----|---------|
|   | FIFO_MODE<1:0> |      |      |      |      |      | FIFO_CH<1 | :0>  | RW  | 0x00    |

FIFO\_MODE<1:0>:

FIFO\_MODE defines FIFO mode of the device. Settings as following

| FIFO_MODE<1:0> | Mode   |
|----------------|--------|
| 11             | FIFO   |
| 10             | STREAM |
| 01             | FIFO   |
| 00             | BYPASS |

FIFO\_CH<1:0>:

FIFO\_CH defines which channel data be stored in FIFO buffer. Setting as following

11, only z axis data be stored in FIFO buffer 10, only y axis data be stored in FIFO buffer 01, only x axis data be stored in FIFO buffer 00, all axes data be stored in FIFO buffer

Register 0x3f (FIFO\_DATA)

| Bit7      | Bit6 | Bit5 | Bit4 | Bit3 | Bit2 | Bit1 | Bit0 | R/W | Default |
|-----------|------|------|------|------|------|------|------|-----|---------|
| FIFO_DATA |      |      |      |      |      |      |      | R   | 0x00    |

FIFO\_DATA:

FIFO read out data. User can read out FIFO data through this register. Data format depends on the setting of FIFO\_CH (0x3e<1:0>).

When the FIFO data is the LSB part of acceleration data, and if FIFO is empty, then FIFO\_DATA<0> is 0. Otherwise if FIFO is not empty and the data is effective, FIFO\_DATA<0> is 1 when reading LSB of acceleration.

## ORDERING INFORMATION

| Ordering Number | Temperature Range | Package | Packaging                     |
|-----------------|-------------------|---------|-------------------------------|
| QMC6981-TR      | -40°C~85°C        | LGA-12  | Tape and Reel: 5k pieces/reel |

# T

#### Caution

This part is sensitive to damage by electrostatic discharge. Use ESD precautionary procedures when touching, removing or inserting.

**CAUTION: ESDS CAT. 1B**
